

INTERACTIVE POWER BI DASHBOARD

BMW Global Sales Intelligence

 [Access Dashboard : Open Power BI Dashboard](#)

Project Summary

This Power BI project delivers a BMW Global Sales Intelligence Dashboard, built to track multi-year performance across regions, channels, and models. It transforms transactional data into clear insights on revenue growth, unit trends, pricing, and portfolio mix—helping stakeholders understand where BMW's sales engine is strongest and how diversified the business really is.

The dashboard combines executive-level KPIs with drill-down views by model, country, and channel, supporting strategic decisions on market focus, channel strategy, and premium vs. value positioning.

Page 1 — Topline Performance

Provides an executive snapshot of BMW's global sales, showing total revenue (~\$376M), units (~15K), and YoY growth. Highlights the top revenue-contributing models and countries, and plots revenue vs. units to show how volume and pricing combine across the portfolio.

Page 2 — Time & Seasonality

Analyzes revenue and units over time at quarterly and monthly levels, revealing how different periods shape the yearly story. Captures MoM and QoQ volatility to identify softer quarters, stronger phases, and overall stability of demand across the 2019–2023 timeline.

Page 3 — Model Portfolio

Deep-dives into the BMW model lineup, comparing each model's revenue, units sold, and ASP. Segments the portfolio into core volume models, premium halo cars, and niche contributors, while matrix views (Model × Channel, Model × Region) show where each model performs best.

Page 4 — Markets & Channels

Explores regional and country-level performance, ranking 5 global regions and 25+ countries by revenue, units, and ASP. Breaks down sales by Wholesale, Dealership, and Online channels, revealing how balanced BMW's geography is and how channel mix shifts across markets.

Page 5 — Pricing & ASP

Focuses on pricing dynamics, tracking median ASP over time to show how BMW has maintained or elevated price positioning despite unit changes. Compares ASP by model, region, and channel, distinguishing premium-priced models from value-oriented ones and surfacing opportunities to refine pricing strategy.
